Students have many opportunities for research—from joining research teams to defining their own research goals. Research projects can span over one semester or an entire year. Typical research projects involve transcription and coding of linguistic data, analyzing speech, and fieldwork. Many students have presented their work at conferences and have gone on to graduate school.

The Undergraduate Linguistics Club is entirely student-run. It sponsors talks by faculty and professionals, panels about applying to graduate school, and linguistic entertainment. It also organizes trips to professional conferences.

The Phonetics and Field Research Laboratory houses state-of-the-art equipment for recording speech and engaging in perceptual research.

Linguistics is a science that aims to understand how humans produce and perceive language. Linguists seek to discover the cognitive processes that underlie the ability to communicate.

Rutgers is home to one of the most respected linguistics departments in the United States, with faculty members that are acknowledged leaders in their fields. The department emphasizes theoretical linguistics and related experimentation and fieldwork. Many diverse languages and language families are studied, from Romance through Benue-Congo, Polynesian, Kalaallisut, and Amazonian.

Students are given a firm foundation in the core areas of linguistic theory. Advanced courses focus on detailed examination of one area, including language acquisition, typology, phonetics, and historical change.

Students often have opportunities to join research teams or engage in their own research under the supervision of faculty members.

Linguistics is very closely related to cognitive science, psychology, and philosophy, with strong connections to computer science, anthropology, and language departments such as Spanish and Portuguese, and French.

A major in linguistics can lead to either an academic or professional career. A number of students have proceeded to study at prestigious graduate programs. Other students have gone on to design educational materials, write or edit in the publishing industry, and build technologies for speech production and processing. Rutgers does not offer a speech pathology program, but students interested in speech pathology often major in linguistics.

Linguistics is offered as a major on Rutgers' New Brunswick Campus.
